

Write up a short document (two to three paragraphs) outlining what you found and what you will test for the usability testing.

The evaluation of WeAudit Taiga AI reveals both positive and negative aspects of its usability. The system generally adheres to the principle of Visibility of System Status by providing feedback on the audit process. It also excels in providing clear feedback on the audit process, displaying progress indicators and status updates throughout the workflow. Users can easily track the status of audits, fostering trust and confidence in the platform. However, there's a significant drawback as users face issues with the loading wheel, which may mislead them about the progress of image generation, causing frustration and uncertainty, potentially leading to issues with being able to trust the website interface.

Furthermore, the platform exhibits inconsistency in terms of user control and freedom, which could confuse users when altering sources for the generator. The lack of a consistent interface poses challenges to users' navigation and understanding. However, there are positive aspects, such as a consistent color scheme and error prevention mechanisms, which enhance the user experience.

Building off of these findings, we will endeavor to test users for the sake of both exploring what may be unintuitive or missing from this website, as well as gathering user insight to find potential solutions to the website. By testing how efficiently users can navigate the primary functions of the website (generating images through AI, creating threads, etc.) and gathering user feedback through both think-alouds and post-testing debriefings, we can improve our understanding of which features work and which need further refinement.
